Spring 2017

Anthony Gitter

gitter@biostat.wisc.edu

Goals for lecture

- Challenges of integrating high-throughput assays
- Connecting relevant genes/proteins with interaction networks
- ResponseNet algorithm
- Classes of signaling pathway prediction methods

High-throughput screening

- Which genes are involved in which cellular processes?
- Hit: gene that affects the phenotype
- Phenotypes include:
 - Growth rate
 - Cell death
 - Cell size
 - Intensity of some reporter
 - Many others

Types of screens

- Genetic screening
 - Test genes individually or in parallel
 - Knockout, knockdown (RNA interference), overexpression, CRISPR/Cas genome editing
- Chemical screening
 - Which genes are affected by a stimulus?

Differentially expressed genes

- Compare mRNA transcript levels between control and treatment conditions
- Genes whose expression changes significantly are also involved in the cellular process
- Alternatively, differential protein abundance or phosphorylation

Interpreting screens

Very few genes detected in both

Assays reveal different parts of a cellular process

Assays reveal different parts of a cellular process

Differentially expressed genes

Genetic screen hits

Pathways connect the disjoint gene lists

- Can't rely on pathway databases
- High-quality, low coverage

- Instead learn condition-specific pathways computationally
- Combine data with generic physical interaction networks

Physical interactions

- Protein-protein interactions (PPI)

[Appling Graz](#)

- Metabolic
- Protein-DNA (transcription factor-gene)

[Yeager-Lotem2009](#)

- Genes and proteins are different node types

Hairball networks

- Networks are highly connected
- Can't use naïve strategy to connect screen hits and differentially expressed genes

[Yeager-Lotem2009](#)

Identify connections within an interaction network

How to define a computational “pathway”

- **Given:**

- Partially directed network of known physical interactions (e.g. PPI, kinase-substrate, TF-gene)
- Scores on source nodes
- Scores on target nodes

- **Do:**

- Return directed paths in the network connecting sources to targets

ResponseNet optimization goals

- Connect screen hits and differentially expressed genes
- Recover sparse connections
- Identify intermediate proteins missed by the screens
- Prefer high-confidence interactions

Construct the interaction network

Transform to a flow problem

Max flow on graphs

Each edge can tolerate different level of flow or have different preference of sending flow along that edge

Pump flow from source

Incoming and outgoing flow conserved at each node

Flow conserved to target

Weighting interactions

- Probability-like confidence of the interaction

Weights and capacities on edges

Find the minimum cost flow

Formal minimum cost flow

$$\min_f \left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} - (\gamma * \sum_{i \in Gen} f_{Si}) \right)$$

Positive flow on an edge incurs a cost

Flow on an edge

Cost is greater for low-weight edges

Parameter controlling the amount of flow from the source

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

Flow coming in to a node
equals flow leaving the node

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

$$\sum_{i \in Gen} f_{Si} - \sum_{i \in Tra} f_{iT} = 0$$

Flow leaving the
source equals flow
entering the target

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

$$\sum_{i \in Gen} f_{Si} - \sum_{i \in Tra} f_{iT} = 0$$

Flow is non-negative
and does not exceed
edge capacity

$$0 \leq f_{ij} \leq c_{ij} \quad \forall (i, j) \in E'$$

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

$$\sum_{i \in Gen} f_{Si} - \sum_{i \in Tra} f_{iT} = 0$$

$$0 \leq f_{ij} \leq c_{ij} \quad \forall (i, j) \in E'$$

Linear programming

- Optimization problem is a linear program
- Canonical form

$$\begin{array}{ll}\text{maximize} & \mathbf{c}^T \mathbf{x} \\ \text{subject to} & \mathbf{Ax} \leq \mathbf{b} \\ \text{and} & \mathbf{x} \geq 0\end{array}$$

ResponseNet pathways

- Identifies pathway members that are neither hits nor differentially expressed
- Ste5 recovered when *STE5* deletion is the perturbation

ResponseNet summary

- Advantages

- Computationally efficient
- Integrates multiple types of data
- Incorporates interaction confidence
- Identifies biologically plausible networks

- Disadvantages

- Direction of flow is not biologically meaningful
- Path length not considered
- Requires sources and targets
- Dependent on completeness and quality of input network

Evaluating pathway predictions

- Unlike PIQ, we don't have a complete gold standard available for evaluation
- Can simulate “gold standard” pathways from a network
- Compare relative performance of multiple methods on independent data
 - Top secret example

Evaluating pathway predictions

Evaluating pathway predictions

Condition-specific genes/proteins used as input

- Genetic screen hits (as causes or effects)
- Differentially expressed genes
- Transcription factors inferred from gene expression
- Proteomic changes (protein abundance or post-translational modifications)
- Kinases inferred from phosphorylation
- Genetic variants or DNA mutations
- Enzymes regulating metabolites
- Receptors or sensory proteins
- Protein interaction partners
- Pathway databases or other prior knowledge
